Water Source Heat Pumps  
**Models 019 to 120**

Refrigerant R407C **R407C**

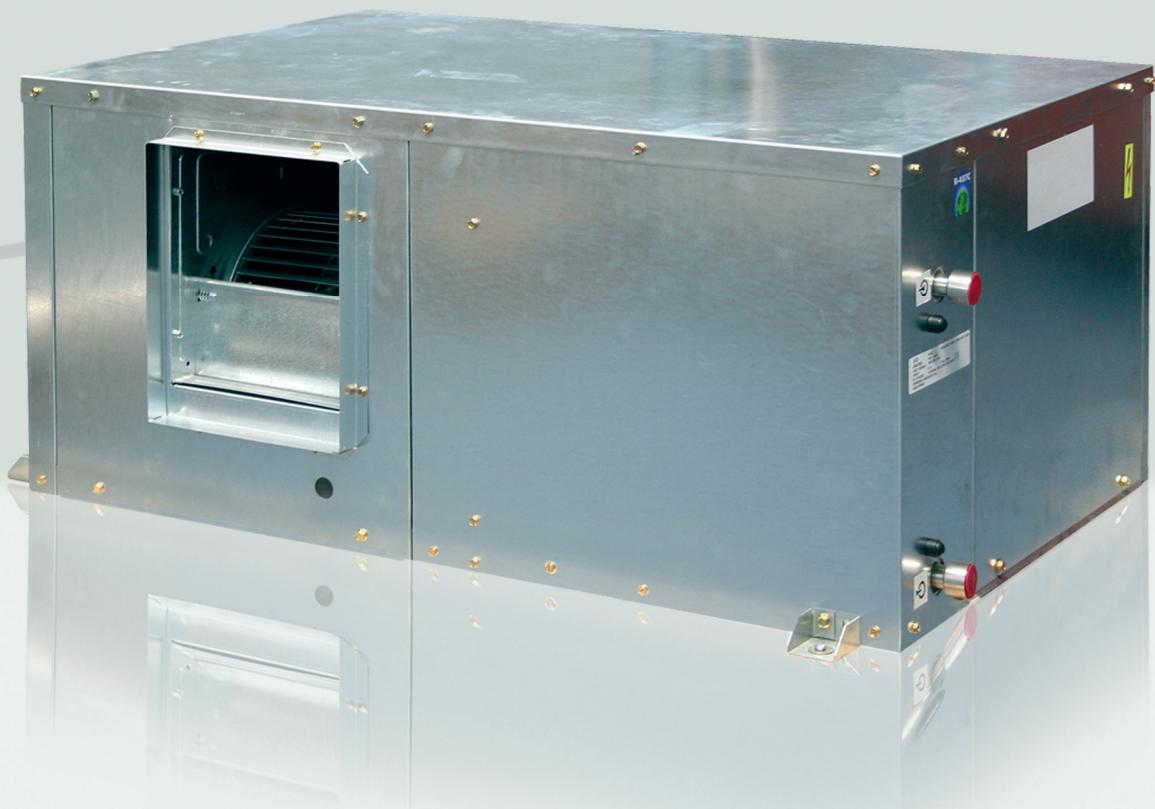

5.8 to 38.1kW

5.3 to 29.9kW

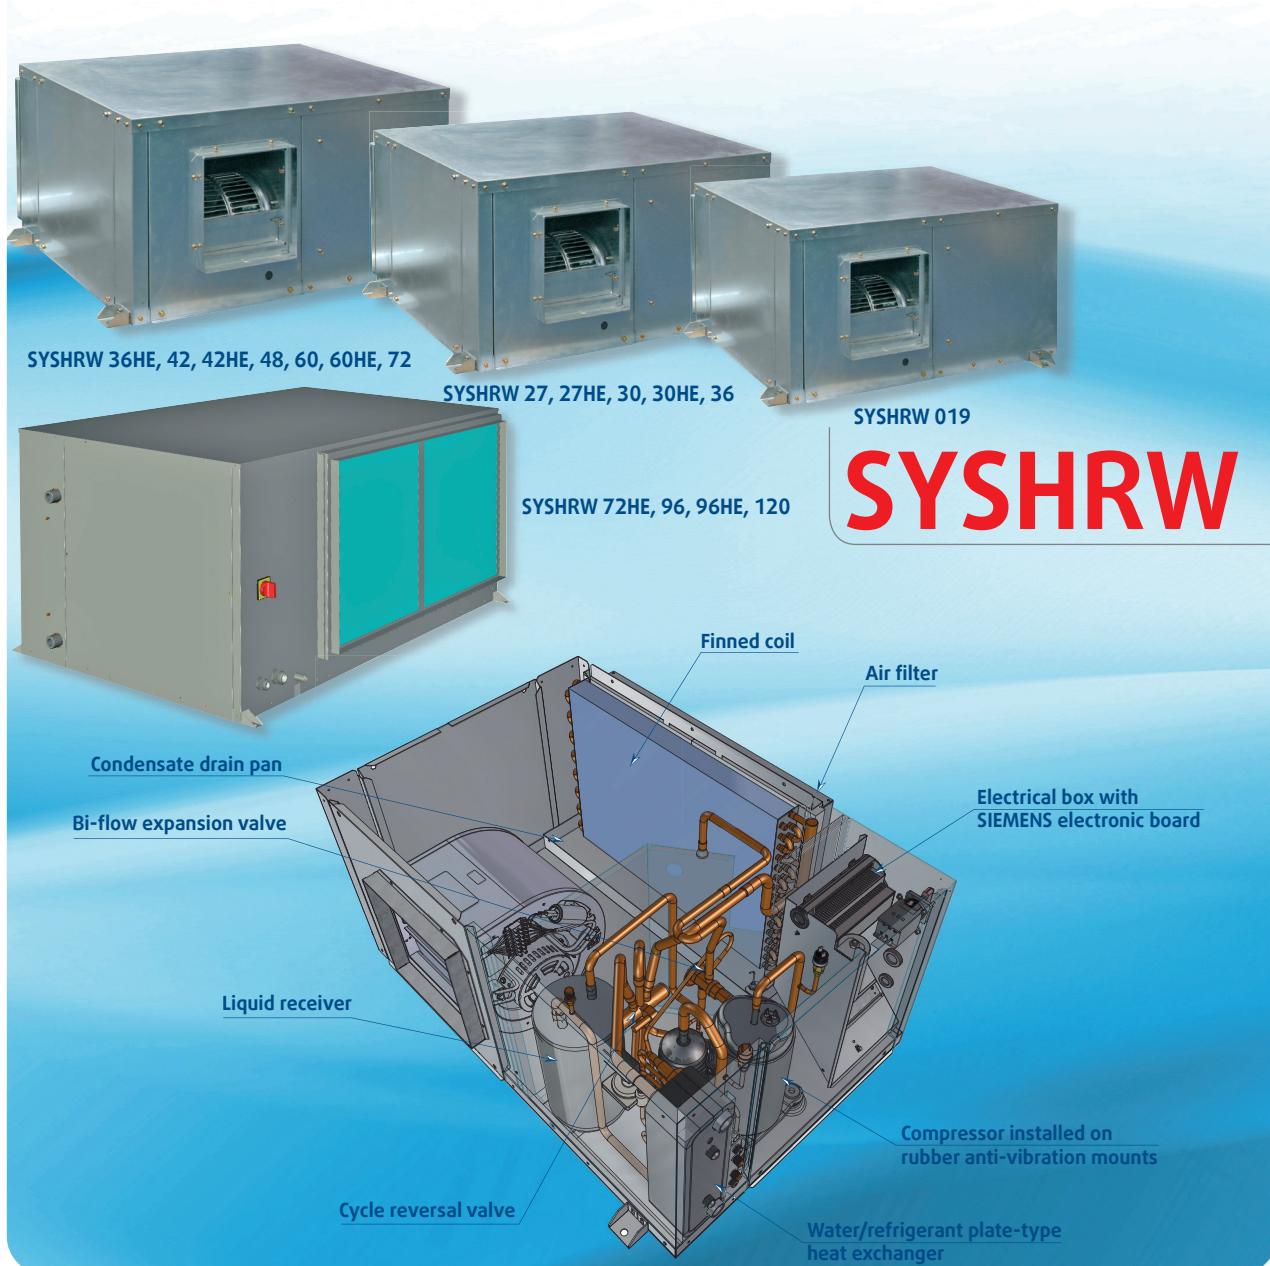

1 250 to 5 600 m<sup>3</sup>/h

# Description of Units

- **4 optimally compact case sizes, 17 models** with a nominal cooling capacity ratings ranging from **5.3 to 29.9kW** and a nominal heating capacity ranging from **5.8 to 38.1kW**.
- High efficiency horizontal units with **high COP** values.
- Easy access to the compressor, fan and electronic control box, through **wide removable panels**.
- **In-line** (S1), or **L air blowing** (S2).
- Condensate drain pan with **anti-corrosion treatment** by oven-baked epoxy paint, equipped with a **float-type safety system** to protect against accidental condensate overflow.
- **3-speed direct drive fan** motor or **belt driven fan** with **variable pitch pulley**.
- **Heat exchanger with brazed stainless steel plates** on the water/refrigerant side, for improved efficiency.
- **Differential pressure switch for antifreeze protection** as standard.
- **Bi-Flow thermostatic expansion valve** for a wide operating range.
- Autonomous control by **Siemens POL423 controller**. The **RCS user remote control** includes a digital display and key control buttons.
- **The optional POL895 removable display** enables the configuration of a master/slaves network of **15 units**.

# Technical Specifications

## Introduction

The new generation of **SYSHRW model reversible water source heat pumps** is the fruit of our considerable product experience and our awareness of the market, all combined with a technology based on the energy efficiency of machines, in order to provide a market offer for **units with the highest performance in terms of COP**.

## Range

The **SYSHRW horizontal units** are designed for installation in specifically designed false ceilings or in technical rooms, and are available with a range of nominal cooling capacity ratings of between **5.3** and **29.9kW** and a range of nominal heating capacity ratings of between **5.8** and **38.1**, with **17 models** based on **4 different case sizes**.

## Operating range

To enable a much wider operating range and operation using a water source in an application with a dry cooler, the standard **SYSHRW** units are designed to operate in a **water source temperature range of between 13 and 48 °C (according to the models)**.

## Casing design

The casing is made of galvanised sheet steel. To facilitate access to the main components, wide removable panels provide access to the compressor, the fan and the electronic control box.

The condensate drain pan has anti-corrosion treatment consisting of oven-baked epoxy paint.

The inside of the casing, on the fan compartment side, is coated with closed cell polyurethane foam thermal-acoustic insulation; this lagging is 15 mm thick and is classified M1. On the compressor compartment side, the thermal-acoustic insulation consists of Isofentre felt, 15 mm thick (except on models 96 and 120).

## Filtration

All units are factory equipped with a G2M1 disposable air filter, 20 or 25 mm thick, according to the models. Optionally, the units can be fitted with G3M1 filter. The filter can be removed/installed from the side of the units without plenum and from the side or from the bottom of the units equipped with plenum, without having to remove the optional return duct.

## Hydraulic connections

The water source outlet and return connectors are located on the outside of the unit, on the compressor compartment side. They are female gas type tapped fittings 3/4" or 1"1/4 (male), according to the models. The condensate evacuation connection is of the smooth tube type, with an outside diameter of 19 mm for models 19 to 72, 22 mm for models 96 and 120.

## Electronic control box

The electrical box is located inside the compressor compartment. A wide access panel is provided to facilitate the maintenance operations.

The electrical power supply required for model 19 is 230 V / 1 Ph / 50 Hz, whereas models **SYSHRW** 27 to 120 require 400 V / 3 Ph / 50 Hz + neutral. The compressors are factory equipped with an internal thermal protection with an automatic reset function.

## Refrigerant circuit

The refrigerant circuit comprises a scroll or rotary type hermetic compressor, a cycle reversal valve, a water/refrigerant heat exchanger, a liquid receiver, a bi-flow thermostatic expansion valve and a finned coil.

The refrigerant circuit also comprises an HP pressure switch with manual reset (range 28-20 bar) and an LP pressure switch with an automatic reset function (range 1.4-2.4 bar). Two Shrader valves (HP & LP) are available for pressure measurement on the refrigerant circuit. The water/refrigerant heat exchanger is of the brazed stainless steel plate type, for increased efficiency. The anti-freeze safety of the heat exchanger is provided, on the one hand, by a water pipe sensor located on the water outlet of the unit and, on the other hand, by a water flow protection monitored by the electronic board. Maximum service pressure is 31 bar. The heat exchangers are particularly well adapted to the operation of reversible heat pumps which have high thermal transfer rates for a low water flow-rate.

The air/refrigerant coil is made up of aluminium fins which are mechanically crimped onto copper tubes. The geometry of the coil and of the fin profile have been carefully designed to provide maximum efficiency in the operation of the units.

The cycle reversal valve is designed to be normally energised in heating mode. This logic enables the heat pump to continue to operate in cooling mode if this valve fails.

The liquid receiver enables the charge of HFC 407C refrigerant to be optimised, particularly in cooling mode, in order to maintain a high COP value.

A Bi-Flow expansion valve ensures and enables a wide operating range with water inlet temperatures which can vary between 13 °C and 48 °C (according to the models) at the minimum or maximum flow-rate.

## Ventilation section

The fan compartment contains the fan-motor assembly, the air/refrigerant coil and the condensate drain pan. The ventilation section is completely isolated from fan compartment by a thermally and acoustically insulated partition wall.

Wide removable panels provide access to the various internal components. The condensate drain pan has an anti-corrosion treatment and comprises a float-type safety device to prevent accidental overflow of the pan.

The sizes 19 to 72 are equipped with a 3 speed direct-drive fan motor with ipsothermal protection against overheating during operation.

The 3 fan speeds can be controlled either manually or automatically by the electronic management board of the unit. The fan-motor assembly is mounted on an independent chassis which is isolated from the casing by anti-vibration mounts.

Belt type drive with variable pitch pulley is supplied on models 96 and 120.

In the standard configuration, the fan blows **straight in line with the air intake**. The **perpendicular blowing** option is available on all units by switching the side panels and the fan-motor assembly.

## Suspension kit

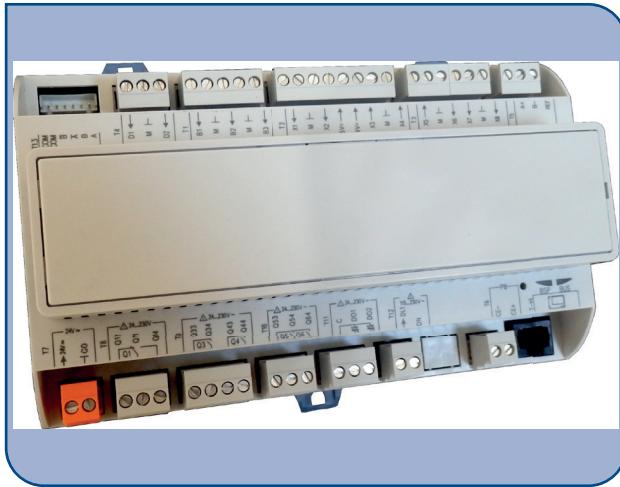

In order to facilitate installation on site, a suspension kit consisting of rubber blocks and washers is supplied with the units (except for models 96 and 120).

## Optional features

- Wired main disconnect switch to be installed on the casing,
- Electric heater at discharge side,
- General alarms fault report,
- Motorized water valve supplied loose.

# Control Features

All **SYSHRW** water source heat pumps are, in their standard version, equipped with a **Siemens** electronic control system which manages their operation and their safety devices.

The configuration of the **Siemens** electronic control enables **four different operating modes** for water source heat pumps by selecting the following systems :

- ➊ Thermodynamic cooling and heating operation;
- ➋ Thermodynamic cooling and heating operation or heating operation with an optional electric heater.

The units are configured and their parameters set with the help of the removable display **POL895** which is available as an option.

**Anti-freeze safety function** : this is provided by two temperature sensors. In cooling mode an "ICT" temperature sensor located in the finned coil protects the water source heat pump against accidental freezing.

In heating mode, the safety function is provided by an "LWT" minimum water outlet temperature sensor.

The automatic reset LP pressure switch completes the anti-freeze safety function by monitoring a minimum acceptable suction pressure to ensure correct operation of the compressor.

**High temperature safety function** : the "ICT & LWT" temperature sensors check that the condensation temperature at the finned coil and the water temperature at the outlet of the water/refrigerant heat exchanger do not exceed the authorised limits.

The automatic reset HP pressure switch completes the high temperature safety function.

**Electric heater** : **SYSHRW** water source heat pumps can be factory equipped with an optional in-duct air heater located at the fan outlet. The electric heaters are also available in kit.

The electric heater function can, depending on the configuration of the **POL423** electronic control, be used in place of the thermodynamic heating as soon as the temperature in the water system drops below a minimum limit, or it can be used as an electric heating system on its own.

## RCS remote control

An **RCS remote control** is supplied **as optional** in the electrical control box of the units.

It enables individually controlled operation or stand-alone regulation. The **RCS remote control** is ergonomically designed and discreet. It comprises a digital display and essential functions such as :

- ➊ On/Off,
- ➋ Selection of operating mode,
- ➌ Room temperature display,
- ➍ Fan speed selection for SYSHRW 19 to 72,
- ➎ Temperature set-point adjustment
- ➏ Alarm code display

**Master/slaves control** : the standard version of the **Siemens** electronic control enables operation in master/slaves regulation mode for **up to 15 water source heat pumps using a single RCS remote control**.

This configuration enables the installer to save on the purchase and wiring of equipment such as auxiliary relays and multi-wire cables between the various water source heat pumps. Only a bus cable with 2 twisted pairs is necessary between the master and slave units.

- (1) Nominal cooling capacities based on : entering air temperature of 27 °C dry bulb, 19 °C wet bulb with entering water temperature of 30 °C.
- (2) Nominal heating capacities based on : entering air temperature of 20 °C dry bulb, 15 °C wet bulb with entering water temperature of 20 °C.
- (3) Absorbed power (compressor + fan) at nominal conditions.
- (4) Nominal currents are given at +/- 5%.
- (5) Starting currents are given at +/- 10%.
- (6) Electric heating coil is available optional.
- (7) Informative data, considering an hypothetical sound attenuation of the room and installation of 21dB.

# Minimum Installation Clearances

When installing the unit, leave enough side clearances for service and maintenance works (see figure below) in order to easily remove the filter and the access panels of electrical box, compressor, fan. Also, leave enough space for water, electricity and duct connection.
