

TIME ec and DV Air Handling Units

Service-friendly and easy to operate

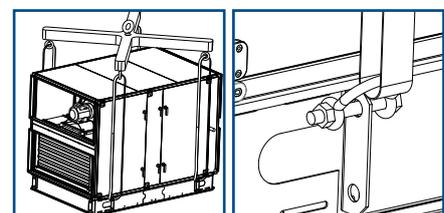

Service-friendly and simple maintenance

Systemair's Air Handling Units, TIME ec and DV, have recently undergone a service upgrade. Here is a brief presentation of the various improvements that ensure a more service-friendly and easy operation.

Lift brackets (standard)

New solid lift brackets are now mounted as standard on TIME ec and DV Air Handling Units selected with a base console. That makes the handling of the unit on the building site easier and faster regardless of where the AHU is installed. The enclosed user manual is updated with detailed instructions about this.

Screen enclosure of fan sections and rotary heat exchanger (standard)

Installation, service, and maintenance of the Air Handling Units must be as risk-free as possible. Therefore, a screen enclosure of the fan sections is now installed as standard. Screen enclosure of the rotary heat exchanger is only on DV 50 or sizes above. The screen enclosure can easily be removed with tools.

Operation of frequency converters via control panel

The frequency converters can now be operated via a control panel placed on the outside of the inspection door. This option makes it very easy to change settings of the frequency converters without having to enter inside the Air Handling Unit.

Sections with lighting

It is now also possible to order lighting in most of the sections. This is adequately designed for those sections where service and maintenance must be performed.
